Our team is focusing on the fifteen questions from the survey about the legality of different actions while driving. People of various levels of education, races, income, and other factors were surveyed. We did our own research to find the correct answers about the legality for each question asked, and compared those answers to the answers given by participants. From the CSV file that contains all of the survey data, we built a function that compares each individual's answers to the Washington State driving laws, and returns a percentage of how closely they actually follow the law. We will compare how each percentage is affected by each social factor as well as how or if that percentage changes over time.
